11. (Cancelled)
12. (Cancelled)
13. (Cancelled)
14. (Previously Presented) A method of manufacturing a clean release magnet, said method comprising the steps of:

printing information on a label layer having adhesive on at least one surface, thereby denoting a first layer;

affixing a pressure sensitive carrier layer, having a clean release adhesive on a first surface and an adhesive on a second surface, to a magnet layer, to thereby denote a second layer; and

affixing said first layer to said second layer, adjacent said magnet layer, to thereby denote a third layer, and simultaneously cutting said third layer to a predetermined depth,

wherein said magnet layer is one of non-tacky and slightly-tacky when removed from said pressure sensitive carrier layer, and a surface of said magnet layer is exposed when removed from said pressure sensitive carrier layer such that when said exposed surface is magnetically attached to a metal surface, said exposed surface directly contacts the metal surface.

- 15. (Original) A method according to claim 14, wherein said adhesive on said second surface is one of a permanent adhesive and a clean release adhesive.
- 16. (Original) A method according to claim 14, wherein said label layer is self-adhering.
- 17. (Original) A method according to claim 14, wherein said label layer is at least one of plain paper, embossed or glossy paper, PVC (Polyvinyl Chloride), PET (Polyethylene Terephlatate) and Tyvek.
- 18. (Original) A method according to claim 14, wherein said magnet layer is one of flexible and rigid.
- 19. (Original) A method according to claim 14, wherein said pressure sensitive carrier layer is one of clear, opaque and having printing thereon.
- 20. (Original) A method according to claim 14, wherein at least one section of said pressure sensitive carrier layer is at least one of clear, opaque and has printing thereon.
- 21. (Original) A method according to claim 14, wherein said pressure sensitive carrier layer has a releasable backing layer affixed thereto.

22. (Original) A method according to claim 14, wherein said cutting is performed by die-

cutting said third layer.

23. (Original) A method according to claim 14, wherein said cutting step separates said

third layer into a usable product matrix and a waste product matrix, said method further

comprising the step of discarding simultaneously said waste product matrix.

24. (Original) A method according to claim 21, wherein said predetermined depth is defined

by a distance from a top of said clean release magnet to a bottom of said clean release

magnet, excluding a thickness of said backing layer.

25. (Original) A method according to claim 14, further comprising the step of automatically

applying said clean release magnet to a product.

26. (Original) A method according to claim 25, wherein said product is a postcard mailer.

27. (Original) A method according to claim 14, wherein said steps of printing, affixing said

pressure sensitive carrier layer, affixing said first layer and cutting are automatically

performed by a machine.

28. (Previously Presented) A method of manufacturing a clean release magnet, said method

comprising the steps of:

providing a label layer having adhesive on at least one surface, thereby denoting a first

layer;

affixing a pressure sensitive carrier layer, having a clean release adhesive on a first

surface and an adhesive on a second surface, to a magnet layer, to thereby denote a second

layer; and

affixing said first layer to said second layer, adjacent said magnet layer, to thereby denote

a third layer, and simultaneously cutting said third layer to a predetermined depth,

wherein said magnet layer is one of non-tacky and slightly-tacky when removed from

said pressure sensitive carrier layer, and a surface of said magnet layer is exposed when

removed from said pressure sensitive carrier layer such that when said exposed surface is

magnetically attached to a metal surface, said exposed surface directly contacts the metal surface.

29. (Previously Presented) A method according to claim 28, wherein said adhesive on said second surface is one of a permanent adhesive and a clean release adhesive.

30. (Previously Presented) A method according to claim 28, further comprising the step of automatically applying said clean release magnet to a product.
